

Raising Product Efficiency

- I) SEAD Initiative
- II) COP26 Product Efficiency Call to Action
- III) Energy Performance Ladder

I) Super-efficient Equipment and Appliances Deployment (SEAD) Initiative

SEAD Ied

The **Super-efficient Equipment and Appliance Deployment (SEAD) Initiative** is a voluntary collaboration between 23 member governments to **promote the manufacture, purchase and use of energy-efficient appliances, lighting and equipment worldwide.**

SEAD supports appliance energy efficiency policies and programmes in its member countries by:

| Increasing partner | Sharing experience | Highlighting the benefits | Increasing awareness |
|--------------------|-------------------------|---------------------------|------------------------|
| participation and | between governments and | and urgency of product | among manufacturers of |
| engagement | partner organisations | efficiency | market potential |

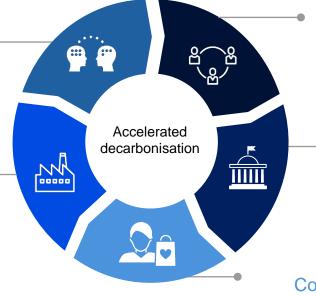

SEAD leadership

- Initially led by the US, SEAD was established in 2009 under the Clean Energy Ministerial
- Coordinated by the IEA since 2019
- Co-led by the UK, European Commission and India since 2016, with the addition of Sweden in 2021
- Became a Task Group of the Energy Efficiency Hub in 2021

SEAD IEC

Access to knowledge exchange and policy support Opportunity to share and learn from 21 member Governments, including through webinars, masterclasses and other events

Manufacturers and industry •-International market is simpler as countries coordinate product policy, bringing benefits for innovation and economies of scale

A framework for coordination

Domestic policy making becomes bettercoordinated with regional and global partners

Governments

Enforcement is simpler and in-country oversight becomes easier, with possibility of reducing imports of lowefficiency products

Consumers

Demand is aggregated and costs come down for essential products and electricity bills reduce

II) COP26 Product Efficiency Call to Action

Doubling the energy efficiency of key products globally by 2030

SEAD has been focusing on **four products that account for over 40% of global electricity consumption**

- 1) Industrial motor systems
- 2) Air conditioners
- 3) Refrigerators
- 4) Lighting

Doubling the energy efficiency of new products of these types sold across all SEAD member countries could

- Reduce electricity consumption by over **4,600 TWh per year by 2030** (equivalent to the generation of more than 2,100 coal-fired power plants
- Avoid 1.9 Gt of CO₂ emissions per year by 2030
- Result in additional benefits for air quality, jobs and health

OSFAD ICO

During its COP26 Presidency, the UK sought to drive international action on product energy efficiency policy. Ahead of COP26, the UK and IEA launched a Call to Action to strengthen the Super-efficient Equipment and Appliance Deployment (SEAD) Initiative to support countries in achieving raised ambition more guickly, easily and at a lower cost. The objectives of the call to action are to:

Set countries on a trajectory to double the efficiency of key products sold globally by 2030 – industrial motor systems; residential lighting, ACs and refrigerators

Support the delivery of crucial **national climate change targets**

Provide consumers and businesses with more efficient products that are **affordable** and cost-effective to own and operate

Stimulate **innovation** and provide businesses with **increased market and export** opportunities

Promote a dual course of action, making products both energy efficient and climate friendly by reducing the use of refrigerants in cooling appliances

SFAD led

Support for the Call to Action

Fifteen SEAD member countries have endorsed the <u>Joint Statement in support of the Call to Action</u>, and SEAD is actively seeking to expand its membership.

The G7 supported the goals of the Call to Action in the <u>2021</u> and <u>2022</u> G7 commitments to action, and in the <u>G7</u> <u>Communiqué by Environment Ministers</u>.

At COP26, SEAD was recognised as a key initiative for international collaboration as part of the <u>Breakthrough Agenda</u>.

OSEAD

III) Energy Performance Ladder

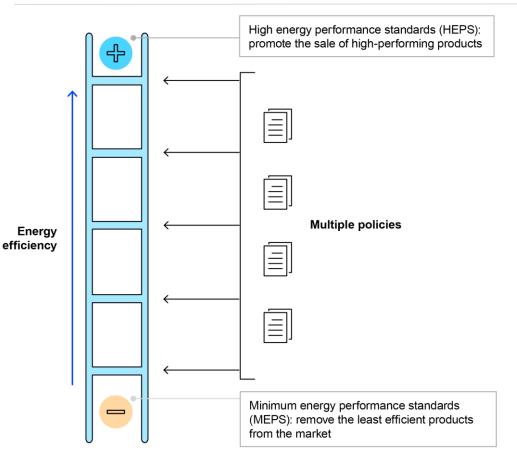

A common framework for improving appliance energy efficiency

Energy performance ladder

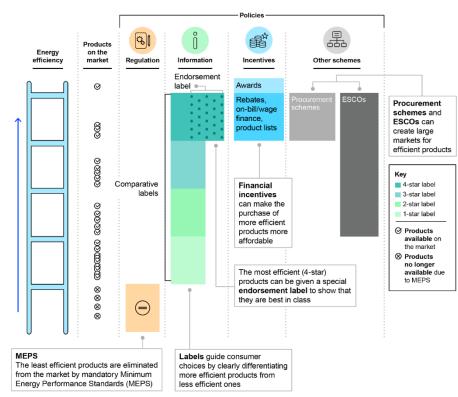

The **energy performance ladder** brings together multiple policies under a single consistent set of performance thresholds. Each step on the ladder represents a level of energy efficiency that a discrete policy threshold is set at. As policies move up the ladder, appliance energy efficiency improves.

SFAD led

The ladder provides a framework that can:

- Show a clear trajectory for improving appliance energy performance over time, by defining how policy will move up the ladder in future
- Benchmark energy performance across markets, while allowing policy to be set that is suited local market conditions
- Aggregate markets to reduce operational costs and increase the customer base of highperformance products

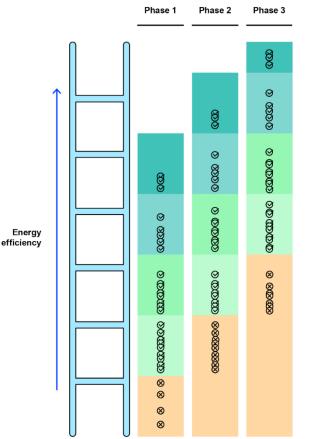

A range of policies can improve the efficiency of electrical appliances, lighting and motors sold in a market.

Ladder 'steps' are defined as energy performance levels, and thresholds for different types of policy can then be set at steps:

- Regulation: Mandatory Minimum energy performance
 standards (MEPS) eliminate the least efficient products from
 the market
- Information: Energy performance labelling allows consumers to make more informed purchasing decisions, given information about a product's energy use and operating costs
- Incentives: High energy performance standards (HEPS) promote the sale of the highest-performing products using financial incentives (such as obligation programmes and rebates) and technology product lists
- **R&D policy** can help drive innovation in the longer term

Moving up the energy performance ladder

The ladder can be used to set out **how policy ambition will increase in** future. For example, a country with MEPS and energy labels can set points in time at which policy thresholds move up the ladder, so that:

- The MEPS level set during Phase 2 would be at the level of the 2-Star label under Phase 1, the 2-Star label during Phase 2 would be at the level of the 3-Star label under Phase 1, etc.
- Another round of rescaling would shift the MEPS level under Phase 3 to the level of the 2-Star label during Phase 2 and the 2-Star label during Phase 3 to the level of the 3-Star label during Phase 2, etc.

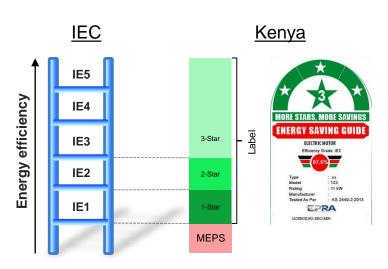

SFAD led

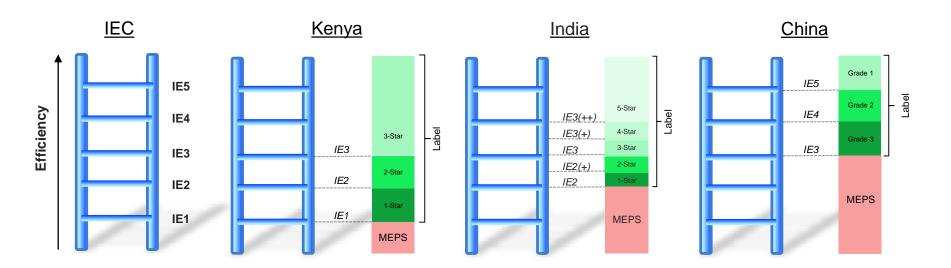

Defining the ladder

Key steps for developing an energy performance ladder, aligning each where possible:

- 1. Agree testing procedures to measure efficiency
- 2. Define efficiency thresholds (ladder steps)
- 3. Map existing requirements by collecting data on the efficiency of stock within the market
- 4. Set the target steps and timeframe to climb the ladder

Motors example:

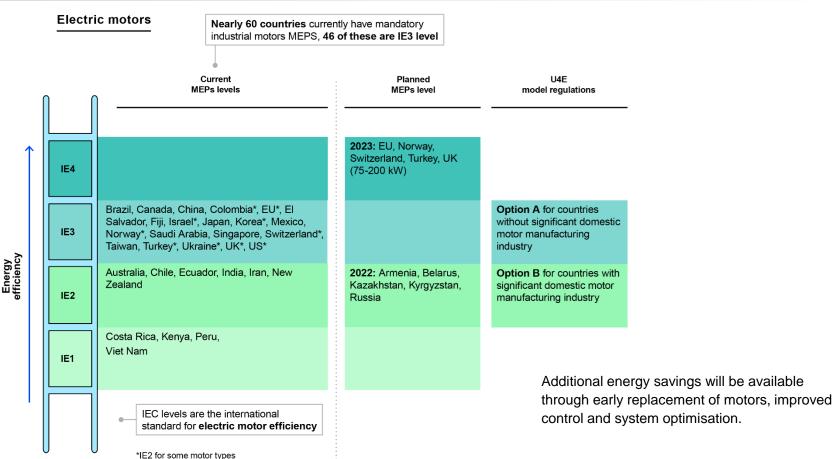

Many countries already use the same ladder for their policy thresholds.

MEPS for industrial motors consistently rely on the IEC Energy Efficiency classes. Kenya, India and China use different levels for MEPS (IE1, IE2 and IE3 respectively). These countries also use steps on the same ladder for their comparative labels.

Other countries use higher steps for incentive programmes.
